

In an increasingly connected world, where social events play a central role in our lives, it has become essential to have a practical platform for creating and sharing events.

What's more, at these events, participants often take lots of photos that they want to share with other attendees. However, it can be difficult to centralise all these photos in one place.

This is the background to the development of the ShareEvent application.

ShareEvent's main objective is to simplify the creation and sharing of events by providing a user-friendly and intuitive platform. Using ShareEvent, users can create events, invite other participants and easily share photos taken at these events. The application aims to provide a seamless user experience and solve the problem of photos being scattered across different social media platforms.

Several popular applications offer similar functionality, such as "Eventbrite", "Meetup" and "Facebook Events".

These applications allow users to create, manage and share events with other participants.

However, these applications focus mainly on the general management of events and do not offer a specific function for centralising photos taken at these events.

Users are often forced to share their photos on different social media platforms such as Facebook, Instagram or WhatsApp, which results in photos being scattered and difficult to find at a later date.
